POSTER · UNIT V

Failsafe decisions

Work down the list: the first YES decides the action

Attitude estimate lost, or battery CRITICAL?
- YES → **LAND NOW**
- NO ↓

Geofence breached?
- YES → **RTL (LAND if position is unreliable)**
- NO ↓

RC or GCS link lost for longer than the timeout?
- YES → **RTL, or continue Auto mission if configured**
- NO ↓

Battery LOW (voltage held below threshold)?
- YES → **RTL if energy allows, else LAND**
- NO ↓

GNSS lost or EKF position unhealthy?
- YES → **AltHold / Land; pilot flies without GPS**

All NO: keep flying the plan, keep monitoring.

Before flight, write down: the action and threshold for each row, from your parameters (FS_THR_ENABLE, BATT_FS_LOW_ACT, BATT_FS_CRT_ACT, FENCE_ACTION, FS_EKF_ACTION).

While flying: if the link is up, the pilot may override with a mode switch. Announce it.

Typical ArduPilot-style priority. Check the actions your firmware is set to.
